

TAMIAS : A privacy-aware & secure distributed storage

Jean Lorchat, **Cristel Pelsser**,
Randy Bush, Keiichi Shima,
Kenjiro Cho, Ray Atarashi

IJ lab report, April 19th 2011

Tamias

- Content sharing
- User: person, company, application
- personal and work storage
- A user may belong to many groups
- Sharing with other users or groups

User has fine-grained control over his data

Objectives and use cases

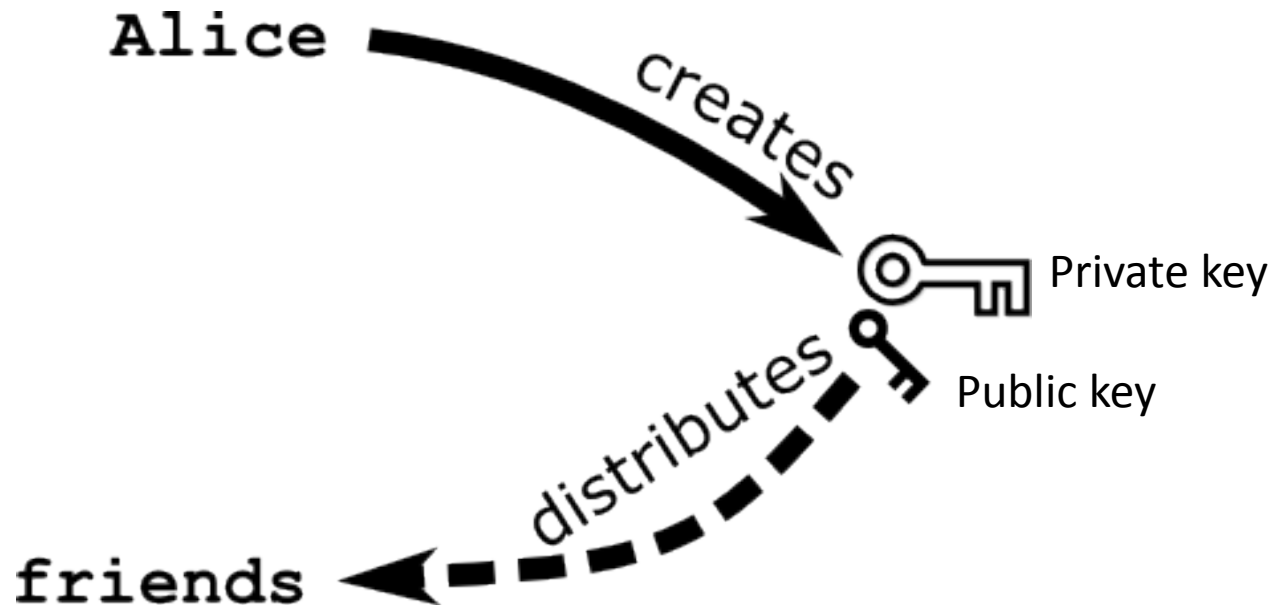

- Content sharing
 - User defines sharing scope
 - No trust in storage provider
 - Anyone can provide storage
 - Easy to use
 - Resilient
 - Scalable
- Use cases
 - Personal storage solution
 - Storage solution for IJ cloud
 - For applications and humans

Sharing

- Sharing is offering
 - unidirectional act of giving someone access (not ownership) to data
- There is no reciprocation
 - Giving access to data does not provision a reciprocate way to receive anything from the recipient
- There may be concurrency
 - Shared data could be modified by the recipient, according to access permissions
- In our context, **sharing** needs a recipient : **identity**

Identity

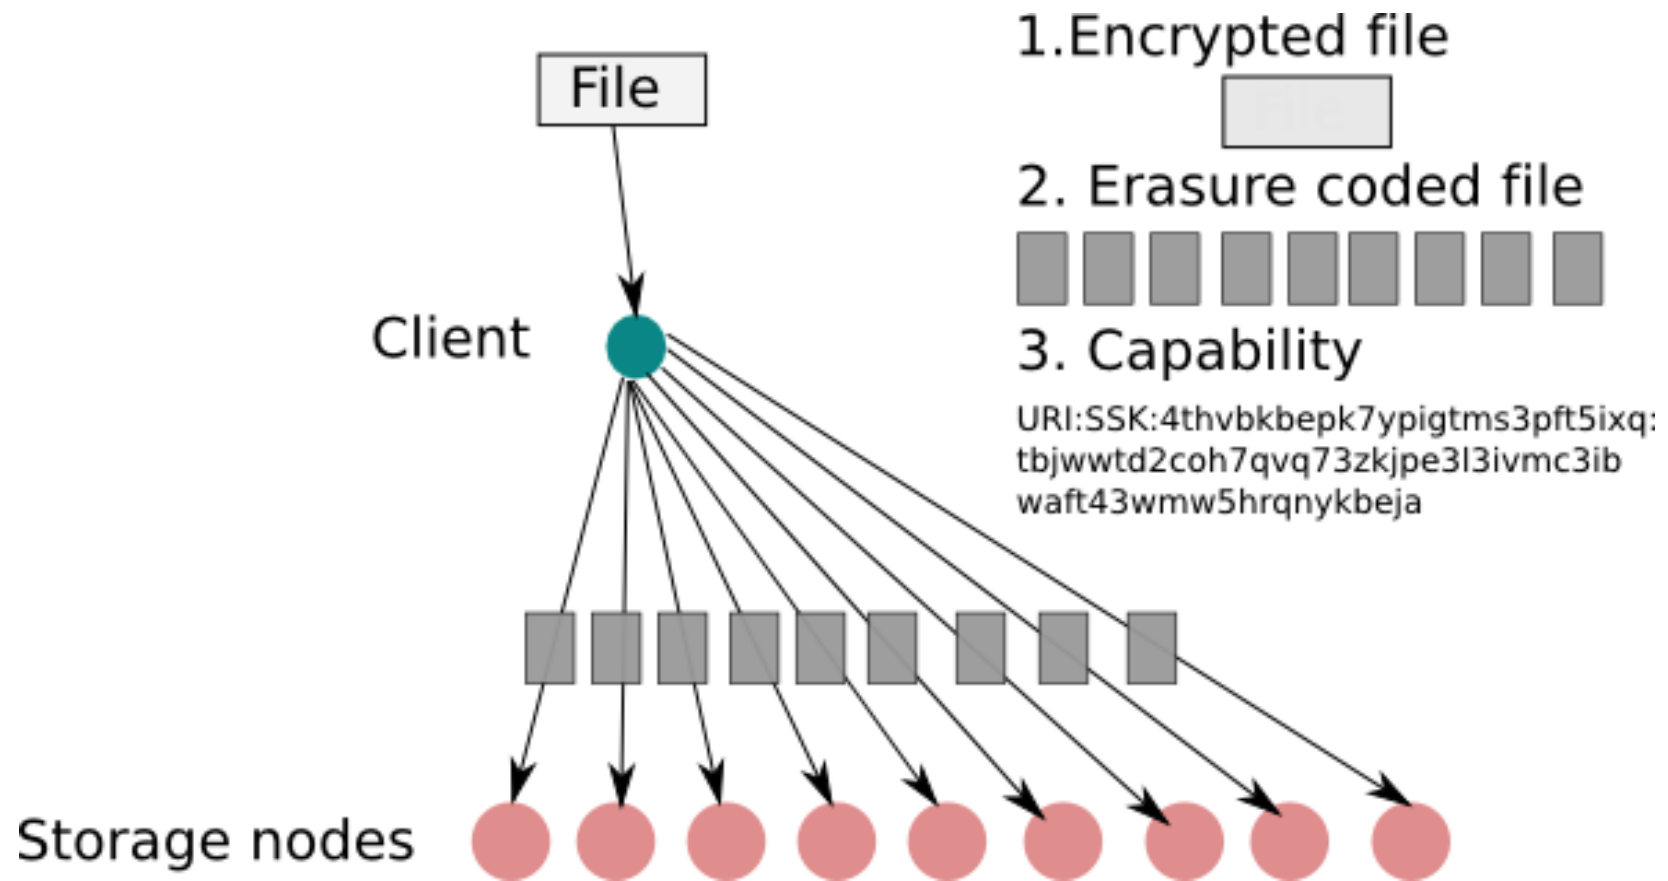

- Identity is a (private key, public key) pair
 - One person may have multiple identities
 - One identity -> content owned and accessible

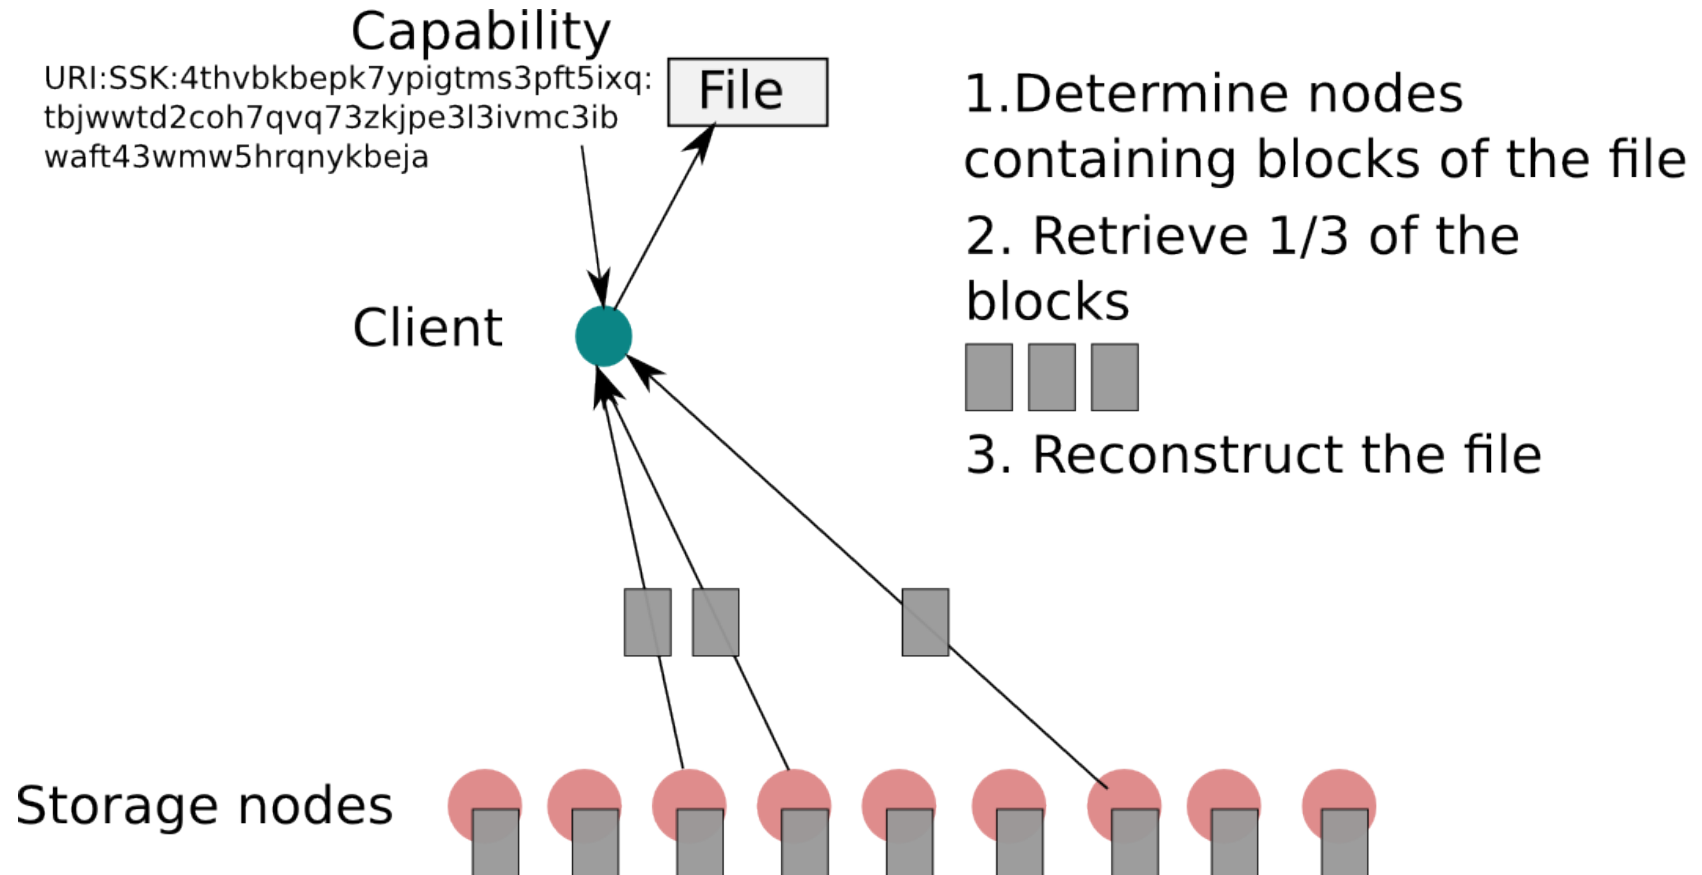

Overview

- This project is at the intersection of two classical areas of research
 - Distributed systems
 - Security and privacy
- As much as we plan to be innovative, there is no need to reinvent the wheel
 - Surveyed existing systems to review how they can fit
 - Chose the Tahoe-LAFS open-source distributed storage project as a working base for **privacy enhancements**

Tahoe-LAFS: file storing

Tahoe-LAFS: file retrieval

Why Tahoe-LAFS

- Fully distributed: **scalable**
 - Storage
 - Capabilities
- Full file encryption: **no trust** on the hosts
 - can be used in a cloud-like environment
- Erasure coding: very **resilient**
- **Open-source**

Need to add ...

- Capability management feature
 - Storage and retrieval of capabilities
 - Sharing of capabilities
 - Same view from multiple devices

Tahoe's built in capability management is very basic

```
jean@shi-chi:~/sources/tahoe/current$ bin/tahoe create-alias root_node
Alias 'root_node' created
No such file or directory
jean@shi-chi:~/sources/tahoe/current$ bin/tahoe ls root_node:
jean@shi-chi:~/sources/tahoe/current$ bin/tahoe mkdir root_node:container
URI:DIR2:leyqyy2uszdv3ekgvo2rqsxsde:igsrcf2gpuc672xfbk3wxgeirinwseyt5bdv2tpcqu6ypzdnayxa
jean@shi-chi:~/sources/tahoe/current$ bin/tahoe cp /tmp/README.txt root_node:container/
Success: files copied
jean@shi-chi:~/sources/tahoe/current$ █
```

Tamias

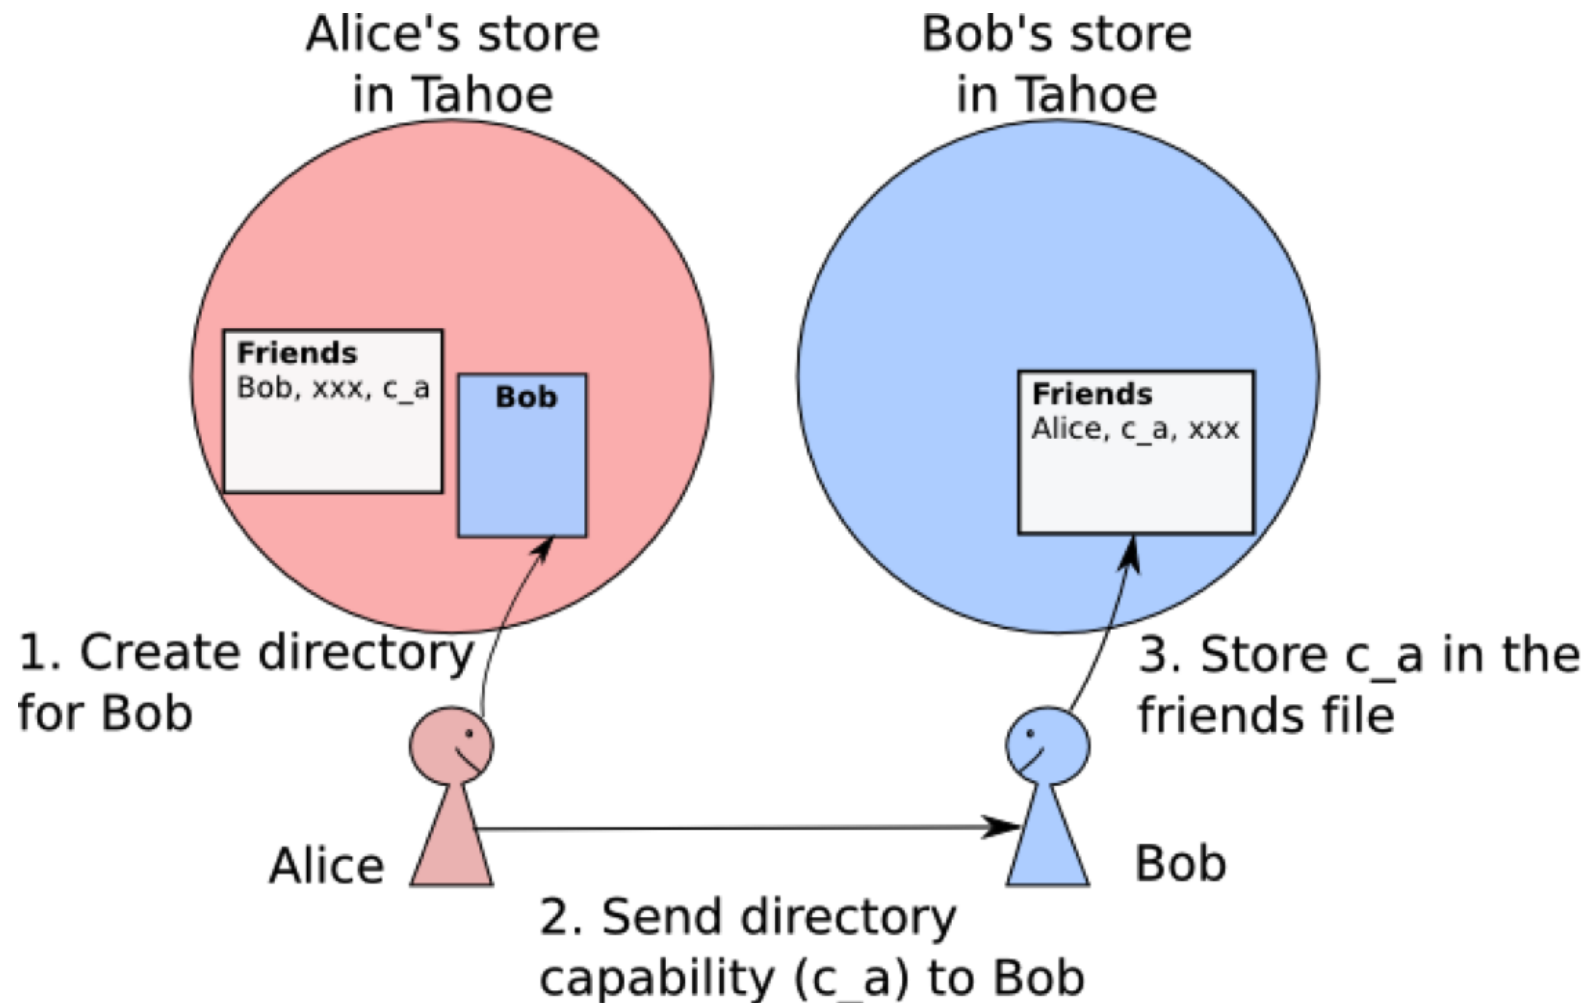

Capability management

- Private key used to generate the root
- Capability to root is the entrance point into all the other capabilities
- Stored in Tahoe-LAFS itself
- Inspired from buddy list: friend -> public key,

Content sharing:

Alice wants to receive files from Bob

Content sharing:

Alice wants to receive files from Bob

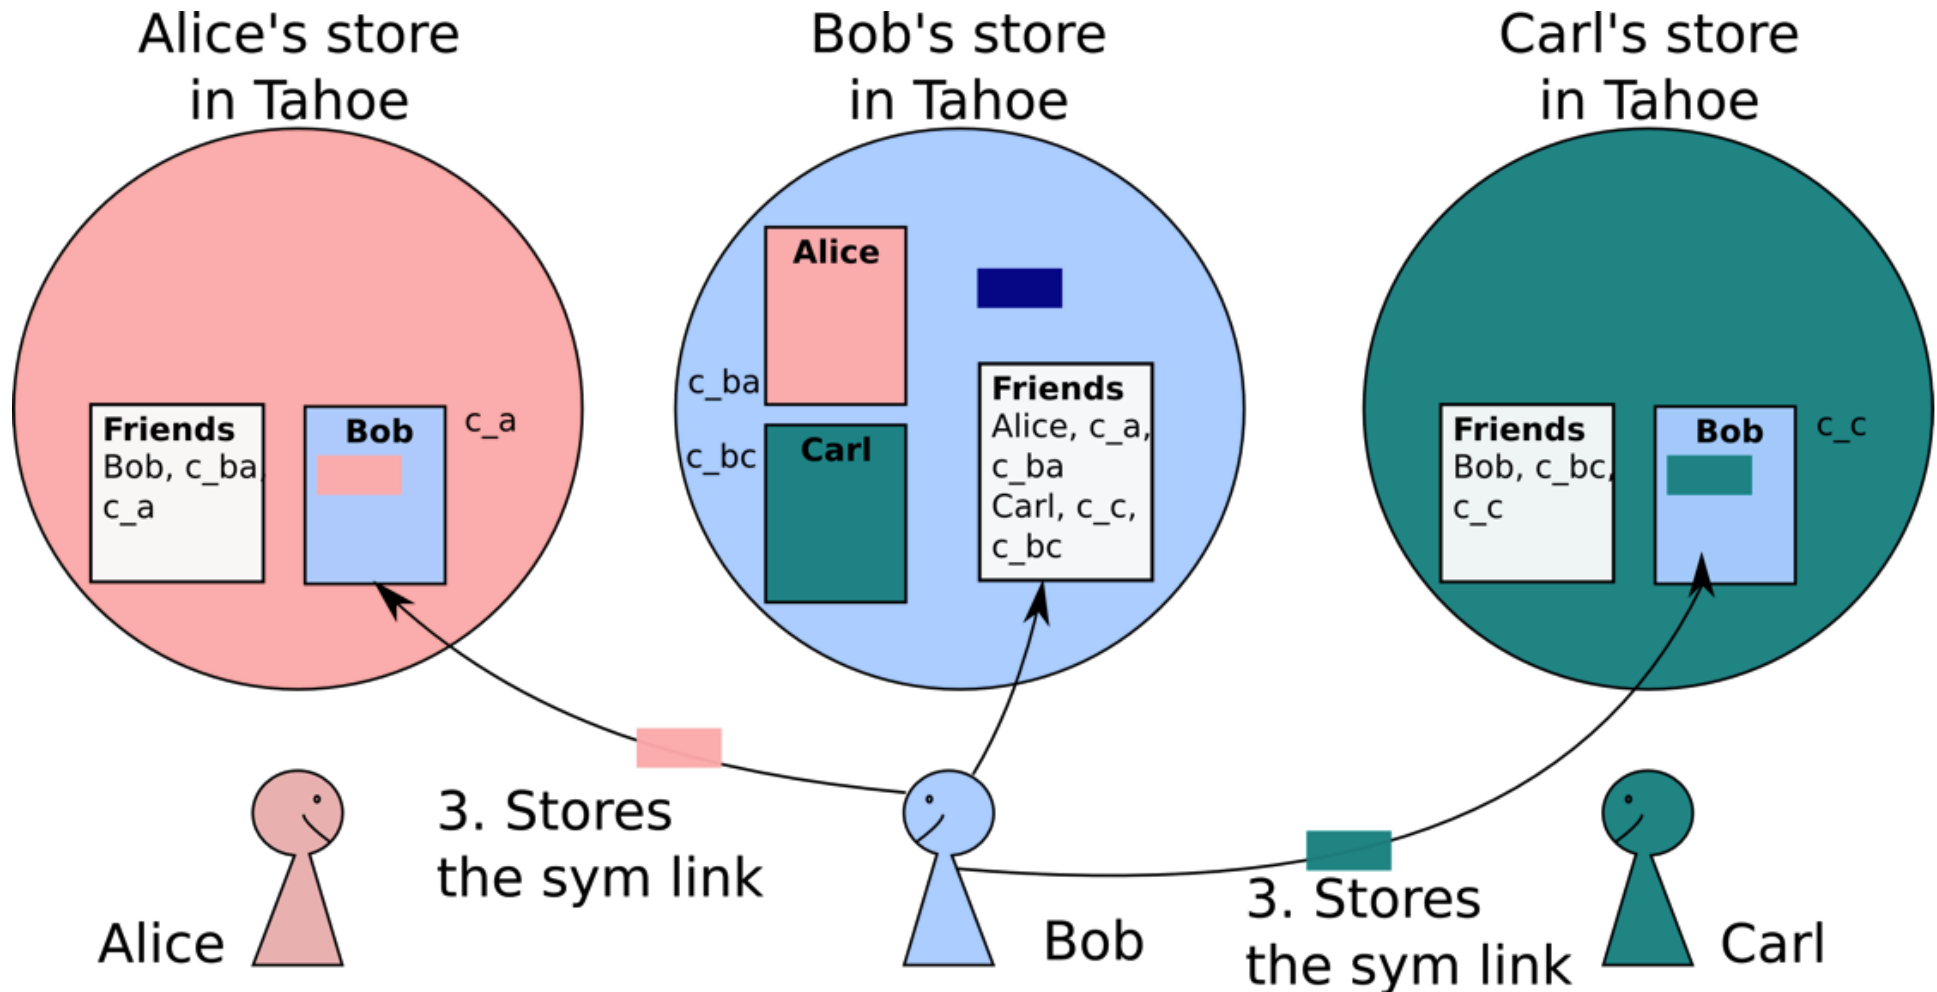

Group sharing

- Objective: be able to revoke access to files on a per user basis
- Generate a symbolic link per destination
- Revoking done by removing the sym link

Group sharing

1. Store the file in own space
2. Generate sym link per destination user

Tamias

Capability management system over Tahoe-LAFS

User perspective	Technical's perspective
Easy to use	Scalable
Multiple devices	Reliable
Fine privacy granularity	Suitable for cloud services
Reliable	

2010-2011 activities

- Survey
 - Distributed storage solutions
 - Online social network solutions
 - Meta-data
- Design of Tamias
- Prototype implementation

Still need to add ...

- Delegation and revocation
- Removal of users by the storage provider
- Multiple storage domains

Jean uploads a file

[My info](#) (shichi)

- [Friends](#)
- [Groups](#)
- [Shares](#)
 - [Show per user](#)
 - [Show per file](#)
 - [Upload a file](#)

- [Cristel](#) (ij)

Choose something to do from the left menu. Meanwhile, here is a list of all your shared files :

['About Stacks.pdf'](#) / [RO access rights](#) / [RW access rights](#)

['cablegate-201012072146.7z'](#) / [RO access rights](#) / [RW access rights](#)

['20101207_labcamp_storage.pdf'](#) / [RO access rights](#) / [RW access rights](#)

['2010120](#)

Upload a file

Upload a file to your own storage space

Choose a file : 20101207_t...ation.odp

Make the file mutable :

Jean shares the file with Cristel

The screenshot shows a web interface for file sharing. On the left, a sidebar contains a 'My info (shichi)' section with links for 'Friends', 'Groups', and 'Shares'. Under 'Shares', there are sub-links: 'Show per user', 'Show per file', and 'Upload a file'. Below this, a list shows 'Cristel (ij)'. The main area displays a list of shared files with links for 'About Stacks.pdf', 'cablegate-201012072146.7z', and '20101207_labcamp_storage.pdf'. A modal dialog box titled 'Share this file READ-WRITE' is open, showing a search bar and a list of users. 'Cristel (ij)' is checked, and a 'Share' button is visible.

Choose something to do from the left menu. Meanwhile, here is a list of all your shared files :

- ['About Stacks.pdf' / RO access rights / RW access rights](#)
- ['cablegate-201012072146.7z' / RO access rights / RW access rights](#)
- ['20101207_labcamp_storage.pdf' / RO access rights / RW access rights](#)
- ['20101207_...](#)

Share this file READ-WRITE X
